Referrals to Denbighshire ANP Care Home Team

The Bar Chart to the left notes the number of referrals per month from January 2017-May 2018 to the Care Home ANP with a total of 2,648 referrals in this 17 month time frame averaging at 156 visits per month which is significant in itself. The Bar Chart to the right demonstrates the breadth of referrals by Practice Cluster; some of the referrals are either on the borders or technically outside of area. This could indicate that patients are possibly having respite/temporary placements from outside of the Central Area thus remaining with their current GP as they will be returning home. However what is important to note is that the majority of referrals 2,425 are from Central /South Denbighshire Cluster Practices. It is anticipated that these referrals will be higher than is currently reflected as during the project there has been limited access to administrative data inputting support.

The table illustrates the number of referrals per month from January 2017-May 2018 from all 14 of assigned Care Homes the ANP supports with a total number of 2,400.Llanrhaeadr Hall EMI Care Home is carrying out the most referrals followed by the Old Deanery Residential Care Home next . However it is felt that the total number of referrals should be higher as their appears to be data discrepancies from November 2017-March 2018 which is associated with the lack of data inputting administrative support during this period.

Central/South Denbighshire Advanced Nurse Practitioner Care Home KPI Report: January 2017-May 2018

Visits by ANP Care Home

This Bar Chart demonstrates the number of visits per month January 2017-May 2018 the ANP has carried out to the Care Homes which is substantial in nature. It is important to note these are visits that the GP previously would have undertaken therefore it has averted 2,534 GP contacts in this timeframe averaging at 158 averted GP contacts per month. This is significant in proving this project is definitely demonstrating its worth with reducing GP contacts. This is a very positive outcome and from this data it could be suggested that a certain % of these ANP visits would have also averted a hospital admission. It can prove difficult to quantify what fully constitutes an averted hospital admission for example if clinical treatments are implemented successfully then there will be no need for a hospital admission. However moving forward Averted Hospital Admissions and WAST callouts will also be captured as part of the Key Performance Indicators which will be illustrated within the service evaluation report.

This chart highlights the 10 highest types of Treatments undertaken which is quite diverse in nature, with Advice and Support (Carers/Care Home Staff) as the highest followed by Medication Review .It also demonstrates the utilisation of the ANP's history taking, assessment, clinical examination and non medical prescribing skills in Treatment areas of Respiratory Examination, and Prescribing Medication.

Summary: Work is underway with the Senior Information Analyst and Care Home ANP to add certain data indicators to the data collection fields such as Non Face to Face contacts which will identify the activity generated not requiring face to face contact, for example referring on to other professionals/departments, liaising with the GP and managing contacts from Care Home staff. Averted Hospital Admissions and WAST contacts will be addressed and other data indicators are being refined in order to provide meaningful data for the service evaluation report. It is important to highlight that some of the data quality issues are related to having limited access to data inputting administrative support which is being addressed.
